Flag question

One needs a good practical example of a “producer-consumer” type problem from among the following.

I. A multithreaded audio server, where a thread writes digitized sound into a circular buffer and another thread reads it over to a web page.

II. A printer spooler where files are spooled onto the printer queue, to be taken and printed by the printer driver.

III. A shared database updated by simultaneous queries.

Which of the following is/are true of such a good practical example?

☐ a. Both (I) and (II)

☐ b. Both (I) and (III)

☐ c. All are true

☐ d. Only (I)

☐ e. Only (II)
