Question **23**
Not yet answered
Marked out of 1.00
🚩 Flag question

Assume the following `x_train, x_test,y_train,y_test=train_test_split(X,Y,random_state=24,test_size=0.2)` identify false statements?

- ☐ a. It is best practice to give either `test_size` or `train_size` while splitting , otherwise the system will use the default 75% for training and 25% testing
- ☐ b. `random_state` helps to reproduce the same train test split each time you run the code
- ☐ c. Assume X is our features, and Y is the label, then we can exchange the order in the code
- ☐ d. `train_test_split` class should be imported from `sklearn.model_selection` library, otherwise will not work
- ☐ e. The `random_state` helps us to set random number for shuffling before splitting our dataset
