Question 23

Not yet answered

Marked out of 1.00

🚩 Flag question

Assume the following `x_train, x_test,y_train,y_test=train_test_split(X,Y,random_state=24,test_size=0.2)` identify false statements?

☐ a. It is best practice to give either `test_size` or `train_size` while splitting , otherwise the system will use the default 75% for training and 25% testing

☐ b. `random_state` helps to reproduce the same train test split each time you run the code

☐ c. Assume X is our features, and Y is the label, then we can exchange the order in the code

☐ d. `train_test_split` class should be imported from `sklearn.model_selection` library, otherwise will not work

☐ e. The `random_state` helps us to set random number for shuffling before splitting our dataset
